HTML - Fundamentals:

- HTML is a markup language that defines the structure of your content. HTML consists of a series of elements, which you use to make it appear a certain way, or act a certain way. The enclosing tags can make a word or image hyperlink to somewhere else, can italicize words, can make the font bigger or smaller, and so on.
- Learning which tags are required for basic HTML
- Creating a text paragraph
- Displaying an image
- Knowing the difference between 'h1', 'h2', 'h3', etc.
- Creating a hyperlinked text
- Creating a form with relevant fields
- Creating an ordered or unordered list of items
- Creating a list of items within a dropdown list
- Linking to a CSS file
- Creating a table
- Adding IDs and classes

CSS - Fundamentals:

- Cascading Style Sheets (CSS) is a style sheet language used for describing the presentation of a document written in a markup language such as HTML or XML. CSS can be used for very basic document text styling — for example, for changing the color and size of headings and links. It can be used to create a layout — for example, turning a single column of text into a layout with a main content area and a sidebar for related information. It can even be used for effects such as animation.
- Learning the visual structure of a page, with 'margin' and 'padding'
- Establishing the size with 'width' and 'height'
- Learning about the position of an element ('static', 'relative' or 'absolute')
- Learning about the display of an element ('block', 'inline', 'inline-block')
- Learning how to position images in relation to text
- Learning about alignment
- Learning about font style
- Learning the differences and advantages of using the different units of measurement in CSS (% , relative, etc)
- Connecting to the elements (IDs, classes) of an HTML file
- Changing the characteristics of an element when the mouse hovers over it
- Learning box-sizing
- Learning Flexbox
- Learning Grid

JavaScript - Fundamentals:

- JavaScript is the world's most popular programming language and is one of the core technologies of the World Wide Web, alongside HTML and CSS. It has dynamic typing, prototype-based object-orientation, and first-class functions. It is multi-paradigm, supporting event-driven, functional, and imperative programming styles.
- Knowing the primitive types
- Declaring variables, considering the difference between 'var', 'let' and 'const'
- Using conditional structures ('if', 'else')
- Know the assignment and comparison operators ('=', '==', '===')
- Using repetition structures and loops ('while', 'for')
- Using functions, passing parameters and arguments
- Manipulating arrays and lists
- Getting data from an API
- Making asynchronous calls using 'Async/Await', 'Promise', etc

DOM - Fundamentals:

- The Document Object Model (DOM) is a programming interface for web documents. It represents the page so that programs can change the document structure, style, and content. The DOM represents the document as nodes and objects; that way, programming languages can interact with the page.
- Understanding how the DOM tree works
- Accessing and manipulating HTML and CSS elements
- Accessing the parents and children of an element
- Inserting a new element to the tree
- Removing an element from the tree
- Waiting for an event on a certain page element using addEventListener()

SPA Concepts:

- A single-page application (SPA) is a web application or website that interacts with the user by dynamically rewriting the current web page with new data from the web server, instead of the default method of a web browser loading entire new pages. The goal is faster transitions that make the website feel more like a native app.
- Understanding what an SPA is
- Establishing routes to other pages
- Knowing SPA frameworks
- Communicating with APIs

React - Components:

- React lets you define components as classes or functions. Components defined as classes provide more features. They accept arbitrary inputs (called "props") and return React elements describing what should appear on the screen.
- Understanding how components work
- Knowing the Styled Components library
- Understanding the difference between class and functional components

React - Props:

- Props are an object that is injected in components and provides some data that can be shared between other components in an uni-directional flow of data, from a parent to a child element. Props are read-only.
- Passing props
- Manipulating props

React Hooks - State:

- The React **useState** Hook allows us to track state in a function component. The **useState** Hook can be used to keep track of strings, numbers, booleans, arrays, objects, etc.
- Control the state of components
- Manipulating variables
- Updating an element or component

- Executing a component only after rendering
- Accessing the props of an element
- Calling APIs

Level 2

React Hooks - Memo:

- The React Hook `useMemo` returns a memoized value. `useMemo` will only recompute the memoized value when one of the dependencies has changed.
- Controlling the state of external variables
- Avoiding expensive calculations on every render

Contents

JavaScript - Callbacks and Promises:

- A Promise is a proxy for a value not necessarily known when the promise is created. This lets asynchronous methods return values like synchronous methods - instead of immediately returning the final value, the asynchronous method returns a promise to supply the value at some point in the future.
- A callback function is a function passed into another function as an argument, which is then invoked inside the outer function to complete some kind of routine or action.
- An async function is a function declared with the async keyword, and the await keyword is permitted within it. The async and await keywords enable asynchronous, promise-based behavior to be written in a cleaner style, avoiding the need to explicitly configure promise chains.
- Understanding the concept of asynchronous programming
- Writing asynchronous code understanding the concept of promises in JavaScript

- Using JavaScript methods, keywords and objects for handling promises like 'Async/Await', '.then()', 'Promise', etc

Service Workers:

- Service workers essentially act as proxy servers that sit between web applications, the browser, and the network (when available). They are intended, among other things, to enable the creation of effective offline experiences, intercept network requests and take appropriate action based on whether the network is available, and update assets residing on the server. They will also allow access to push notifications and background sync APIs.

Git & GitHub - Fundamentals:

- Git is a free and open source distributed version control system designed to handle everything from small to very large projects with speed and efficiency.
- GitHub is a hosting service for software development and version control using Git.
- Creating a repository
- Cloning a repository
- Committing, pushing and pulling to and from the repository
- Reversing a commit
- Creating branches and pull requests
- Handling merge and conflicts

Cloud - Fundamentals:

- Cloud, or cloud computing, is the distribution of computing services over the Internet using a pay-as-you-go pricing model. A cloud is composed of various computing resources, ranging from the computers themselves (or instances, in cloud terminology) to networks, storage, databases, and everything around them. In other words, everything that is normally needed to set up the equivalent of a server room, or even a complete data center, will be ready to use, configured, and run.
- Knowing the difference between IaaS, PaaS and SaaS
- Knowing the largest cloud providers

YARN:

- Yarn is a package manager for your code. It allows you to use and share code with other developers. Code is shared through something called a package (sometimes referred to as a module). A package contains all the code being shared as well as a package.json file which describes the package.
- Managing packages
- Managing dependencies
- Installing packages offline
- Commands
- The yarn.lock file
